Rue de Terrebonne at night, 2015: every surface by its height, trees removed

City of Montréal airborne LiDAR, flown on two weeknights between midnight and 4 a.m., before the bike lane; Grand to Melrose, north side above. Red = objects of car height at the curbs and in driveways. Dotted lines: the driving lanes (2.2 m either side of the axis), where a moving car would appear; dashed red: the side the proposal would turn into winter parking.

ground, pavement, lawns (< 0.3 m)
low objects: fences, hedges, steps (0.3–0.9 m)
car height (0.9–2.3 m): parked cars
garages, sheds, vans, porches (2.3–3.6 m)
houses (> 3.6 m)
Side where the lane would become parking each winter (the proposal, as the councillor described it)

Source: Ville de Montréal, LiDAR aérien 2015 (CC-BY 4.0), height above ground from the point cloud with vegetation returns removed (pdal), 0.2 m cells, hillshaded; parcels: unités d'évaluation foncière (CC-BY 4.0). On the whole street, 183 car-height objects were counted by eye at the Terrebonne curbs that night (north 93, south 90); an automatic detector finds 85.
